# Read the following passage and choose the letter A, B, C or D to indicate the correct word or phrase that best fits each of the numbered blanks:

Hi, readers! I saw a really interesting documentary last night about new technology. It doesn't just affect our schools, our homes and our cities; it affects our jobs, too. Part of the documentary showed just how much technology (26) the world of work in the future, and I know many of you are teens (27) career choices very soon. To begin with, there will probably be floating offices on lakes and on the sea. This is because people will build houses

To begin with, there will probably be floating offices on lakes and on the sea. This is because people will build houses on all the green spaces and there will be less room for new buildings on land. Also, more people will (**28**) work from home. For example, people will do work online and send it to an office. That will probably result in fewer office buildings in the centre of the city.

On the other hand, some people may (29) \_\_\_\_\_\_their jobs in the future. Consider the example of robots. These will replace some people. Robots have already replaced some factory workers, but now they will begin to replace other jobs, too. (30) \_\_\_\_\_\_, traditional jobs will certainly disappear. For instance, some shops won't accept cash so that will mean fewer cashiers.

The jobs we do and the way we do them might be very different in the future. I think that the future will be a great place to work as long as we can find jobs for all the people that may lose their jobs. We mustn't forget about them. So what are your opinions, readers? Leave me your thoughts in the comments below.

## Read the following and mark the letter A, B, C, or D on your answer sheet to indicate the correct answer to each of the questions :

Amphibians are an animal group that includes frogs, toads, salamanders, and newts. These animals live in and out of the water. The number of amphibians on our planet is declining rapidly in both local mass extinctions and population crashes. This is a cause for concern as many scientists believe that humans are responsible.

Since the 1980s, scientists have **noticed** a decline in amphibian populations. Although many animals are affected by humans, amphibians have been hit particularly hard. Some scientists believe this is because of their two-stage life cycle. Unlike most animals, amphibians live their lives in two distinct stages. The first is aquatic and the second is terrestrial. This means amphibians are sensitive to environmental changes in the water and on land. They also have permeable skin, which means that toxins and chemicals can easily get into their bodies.

At first, some scientists did not believe that human pollution was the cause for changes in amphibian populations. These scientists believed that every species on Earth goes through natural cycles and changes and that there was not enough long-term data to prove that humans were the problem. In recent years, this has changed. Almost all biologists are concerned about the decline in amphibian populations. <u>They</u> are worried not only because many amphibians may go

A. a

extinct, but also because these extinctions will affect other plants and animals in ecosystems. They believe that the decline in amphibian populations is a warning to humans to stop polluting and clean up Earth.

# Read the following passage and mark the letter A, B, C, or D on your answer sheet to indicate the correct answer to each of the questions

Given the American manufacturing tradition, it was also inevitable that cars would be produced in larger volume at lower prices than in Europe. The absence of tariff barriers between the states encouraged sales over a wide geographic area. Cheap raw materials and a chronic shortage of skilled labor early encouraged the mechanization of industrial processes in the United States.

This in turn required the standardization of products and resulted in the volume production of such commodities as firearms, sewing machines, bicycles, and many other items. In 1913, the United States produced some 485,000 of the world total of 606,124 motor vehicles.

The Ford Motor Company developed more quickly than its rivals in reconciling state-of-the-art design with <u>moderate</u> price. Cycle and Automobile Trade Journal called the four-cylinder, fifteen-horsepower, \$600 Ford Model N (1906-1907) "the very first instance of a low-cost motor car driven by a gas engine having cylinders enough to give the shaft a turning impulse in each shaft turn which is well built and offered in large numbers." Deluged with orders, Ford installed improved production equipment and after 1906 was able to make deliveries of a hundred cars a day.

Encouraged by the success of the Model N, Henry Ford was determined to build an even better "car for the great multitude." The four-cylinder, twenty-horsepower Model T, first offered in October 1908, sold for \$825. Its two-speed planetary transmission made it easy to drive, and features such as its **<u>detachable</u>** cylinder head made it easy to repair. Its high chassis was designed to clear the bumps in rural roads. Vanadium steel made the Model T a lighter and tougher car, and new methods of casting parts (especially block casting of the engine) helped keep the price down. Committed to large-volume production of the Model T, Ford innovated modern mass production techniques at his new Highland Park, Michigan, plant, which opened in 1910. The Model T runabout sold for \$575 in 1912, less than the average annual wage in the United States.

By the time the Model T was withdrawn from production in 1927, <u>its</u> price had been reduced to \$290 for the coupe, 15 million units had been sold, and mass personal "automobility" had become a reality.

<b>Question 36</b> : What is the main idea of the fourth paragraph?
